How do I export records from PubMed to EndNote?

There are 2 ways of doing this, by searching PubMed from the EndNote interface or by searching from the PubMed site, saving and then importing into EndNote.

**Searching PubMed from EndNote and import references directly to your library.**

1. Open your EndNote Library.
2. Click on the World or Globe icon at the top left corner of your Window to switch to Online Mode.
3. Select Tools -> Online Search
4. Scroll the list of database names and select PubMed (NLM) and click on Choose. This will open the EndNote connection search box and connect you to the PubMed at NLM Server.
5. Conduct your search in the lower pane of your screen using the fields provided in the dropdown lists.
6. Once you have performed your search and clicked ok, the records are displayed in an interim window. Select the references you want to include in your EndNote library. Highlight all or select particular references by holding down the CTRL key and clicking.
7. Right Click on Copy references To and choose your EndNote library from the drop down list.
8. The new references are added alphabetically into your selected Library.

**Searching at the PubMed website (http://www.ncbi.nlm.nih.gov/pubmed/advanced), selecting records and exporting them to your EndNote library.**

1. Conduct your search
2. If you want to export selected records mark the box next to those required.
3. From the 'Send to' menu select Citation Manager and the number of records you want to export.
4. Click on 'Create File'
5. At the prompt choose EndNote and OK If you are prompted to choose an import filter from a list, highlight PubMed and click on ‘Choose’
