What is a From Group?

A From Group lets you create a new group from existing Groups in a Library. You can combine existing Groups and Smart Groups using the Boolean operators And Or Not. A From Group allows you to create a more refined group or a larger group, depending on the Boolean operator you choose.

To create a From Group

1. Right click a Group Set where you want to list your From Group and select Create From Group.
2. At the window give your From Group a descriptive name.
3. Use the arrows in the drop down windows to view and select from existing groups you want to combine.
4. Select from the Boolean Logic operators provided in the drop down window.
5. The image below shows the creation of a From Group to identify records which belong to the group “Australia affiliation or content” AND the group “Uploaded to RGMS”
